WADP 410 – Lab #2

Objective: In this lab, we will try to understand principles of design and how to use it in creating web pages.

1) In this task we will try to understand what makes a website's user interface (UI) good.
    a. Go to Google Classroom and take a look at its User Interface. Then discuss with your team members whether you like Google Classroom UI or not.

    -> I like Google Classroom UI as it's simple so I can easily understand.

    b. Write down three positive things about Google Classrom UI

    -> 1. It's very simple. 2. It uses less color so I can be easy to read.
    3. It has less function so it's easy to understand using.

    c. Write down three negative things about Google Classrom UI

    -> 1. It has less explanation so someone cannot understand its use.
    2. Clickable range of the attached document is a little small. I think it should be bigger.
    3. I'd like to set the username differently from the Google account.

2) We will plan a biography web page (web page NOT *website*). With your team:
    a. Discuss what should be on a biography web page and draw wireframes (ON PAPER).

    -> Please show the attached document.

    b. Examine these pages and discuss:
        i. https://www.notablebiographies.com/Ma-Mo/Michelangelo.html

        -> It's difficult to read as it's many sentences.

ii. https://www.biography.com/writer/charles-dickens

-> It's better than the previous webpage. It's bigger font-size and it has more pictures than the previous webpage so it's easy to read.

3) In VS Code, create a HTML web page based on your team's wireframe. Look at HTML Reference as you need (but understand before you put something in your code).

-> Please show the attached document.

4) Finally, we will draw the DOM tree of our web page.
    a. Look at your html document's structure and tag hierarchy
    b. Either on Cacoo.com or by hand, draw the DOM tree of your html file

5) Upload and Submit all your work on Google Classroom to Week 1 > Lab 2.
